Content

Introduction

Purpose

Scope

It will facilitate speech and hearing impaired people to ease their communication.

It can be used in offices, institutions or seminars.

It would help both our community and university to build a startup and educate these specially-abled people.

Overall Description

Product Perspective

DivyaAnuvadak will serve the speech and hearing impaired people by providing their gestures converted to the equivalent text.

This system will consist of one web portal. This web portal will be used for converting gestures into its corresponding text. The predefined gestures will be stored in the memory and will be compared with the original gesture performed by the user.

User performing gesture

Converted to text

Product Function

Capture the gestures made by the user through a web camera.

Recognizing the gestures through Tensorflow Object Detection API by identifying features.

Pre-Processing the captured data.

Feeding the data to the model.

Predicting the word based on processed model.

Selecting the word of highest possibility.

Converting the word into text and displaying it on the screen.

Hardware Interface

- **SERVER SIDE:**

RAM : 8 GB (minimum)

HDD : 1 TB or more

Processor : Intel® i3 or faster (2–4 GHz)

GPU : 2 GHz or more

- **CLIENT SIDE:**

RAM : 8 GB (minimum)

HDD : 512 GB or more

Processor : Intel® Pentium or faster (2-4 GHz)

Camera : 720 Pixels or more

Software Interface

- **SERVER SIDE:**

Operating System : Windows 10 or 11

Web Server : Apache Tomcat (v10)

IDE : Jupyter Notebook (v6.4.8), VS Code (v1.74.3)

Programming Language : Python

- **CLIENT SIDE:**

Operating System : Windows 7 or higher versions

Web Browser : Any Browser

Library : Streamlit

User Characteristics

User is required to have basic knowledge of computing and internet surfing.

User should have good knowledge of ISL and English.

Constraints

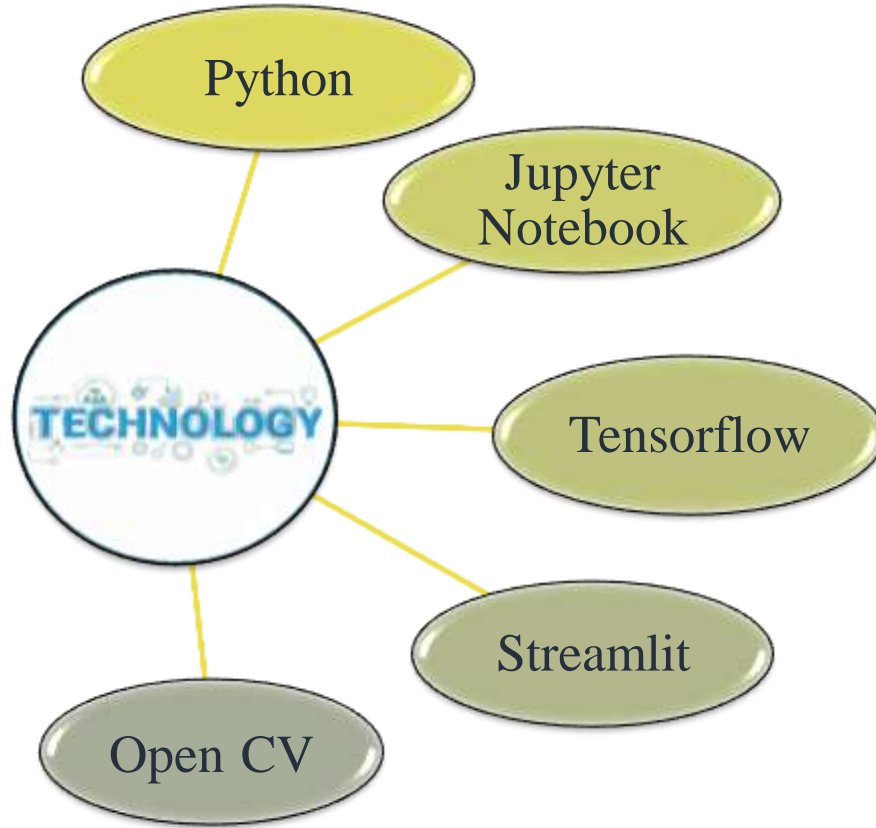

Hardware limitation on mobile devices.

Full-fledged translation is not possible.

Only one-way communication is possible.

Fast-paced communications are not possible.

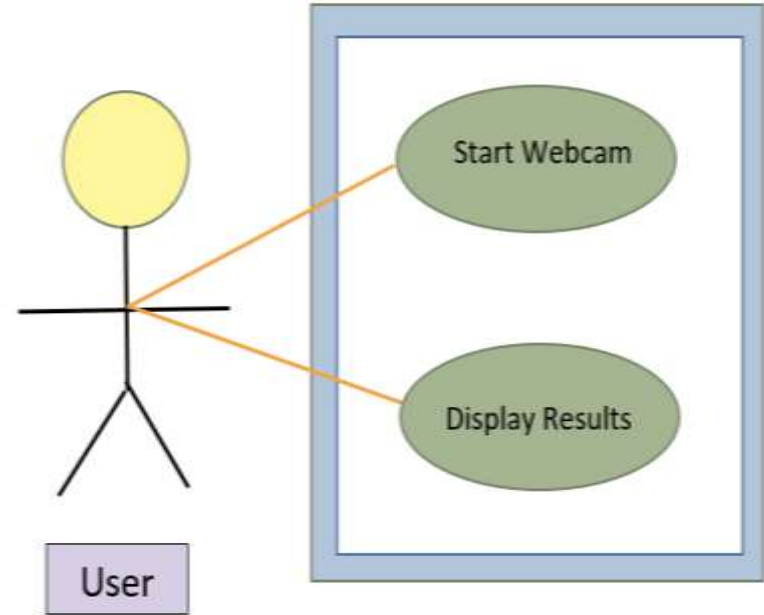

Technologies Used

Specific Requirements

Functional Requirements

Use case Name	Sign Language Recognition
Participating actors	User
Flow of events	Start the system(u) Capturing video(s) Capture gestures(s) Extract features(s) Match features(s) Recognizing gestures(s) Display result
Entry condition	Run the code
Exit condition	Displaying the text label
Quality requirements	Cam pixels clarity, good light condition

Use Case Diagram

Non-Functional Requirements

Availability

- This web application will be available free on the internet. The users do not require to login so it is user friendly.

Security

- This web application does not ask for any personal information from the user. Hence it is a secure application.

Reliability

- The application will be 99% reliable and will produce correct speech for the corresponding gestures.

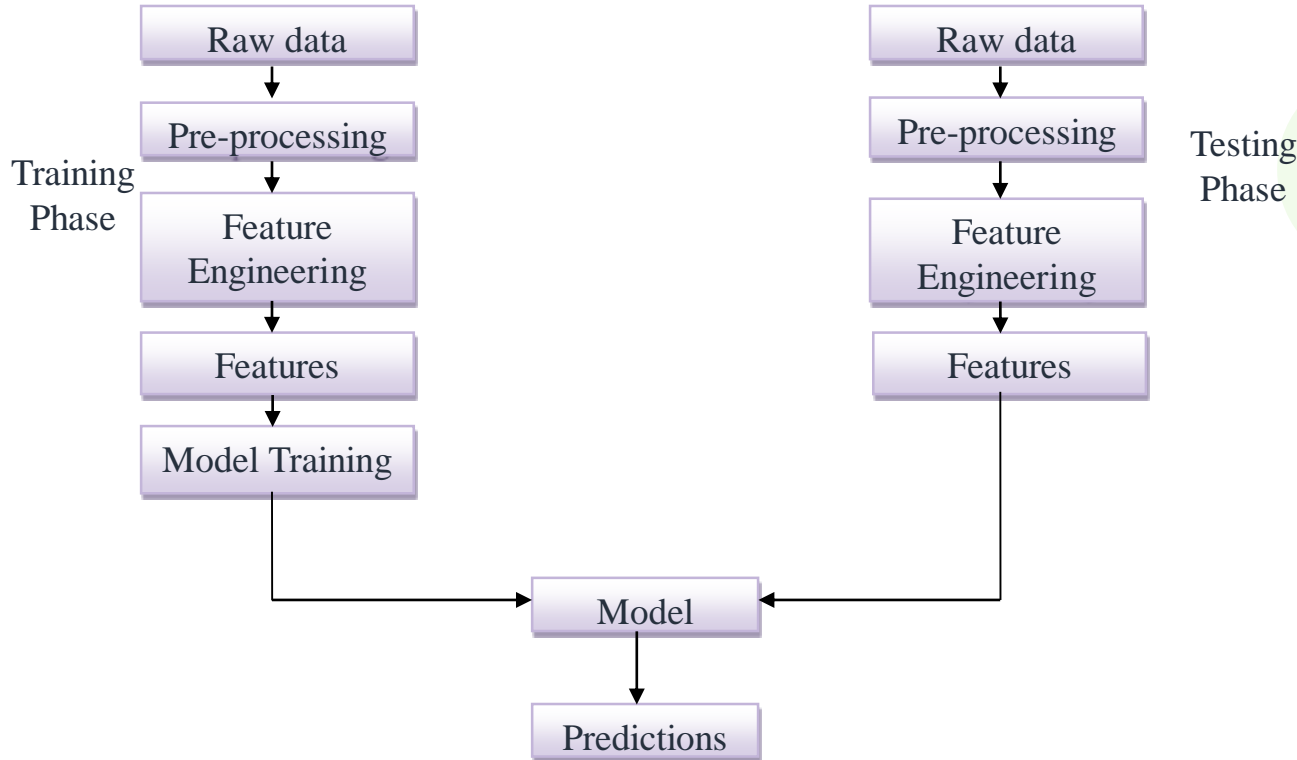

Portability

- This project is a web application so it will be available online and can be accessed from any device having internet connectivity, e.g.: laptops, computers, mobile devices etc.

System Architectural Design

User Interface Design

Description of the user interface

- + **Input** – Hand Gesture
- + **Output** – Corresponding Text.

Processing Details

- + The hand gestures given by the user through web-camera will be processed.
- + Then it will be checked whether the input is valid or not.
- + Eventually, the system would generate the corresponding output text in the text window.

Description of Component

+ **Gesture Window**

- + In this window, user would provide hand gesture as input which would be further verified and processed by the system.

+ **Text Window**

- + In this window, corresponding text will be displayed with respect to the valid hand gestures.

Screen Image

Objects and Actions

+ **Object** – Textbox

+ **Purpose** – To convert hand gestures into text

+ **Action** – Gesture

+ **Response** – Corresponding text output of gesture

Types of Tests

- ❖ **Unit Tests**: This test is applied on each of the module to find whether or not each module is properly working or not.
- ❖ **System Tests**: Black box testing or system testing involves the external working of the software opposite to white box testing which checks for the internal working or code of a software application.
- ❖ **Integration or Regression Tests**: After unit test integration testing is done to test if the entire system works together correctly. While regression testing tries to ensure that a newly added feature or modified code does not break any functionality already working in the existing system.
- ❖ **Stress Tests**: Here we provide our software with some unfavorable conditions to check how they perform in such conditions.
- ❖ **Acceptance Tests and Staging**: This test will ensure that the quality of the product is not compromised.
